CARATTERISTICHE TECNICHE:

Soffiante centrifuga multistadio ad alta pressione di larga applicazione d'impiego, fra cui citiamo:

Pulizia pneumatica – Trasporti pneumatici – Posta e campionature pneumatica – Agitazione di liquidi – Rimozione di liquidi con getto di aria – Cortine d'aria – Ventilazione di gallerie – Tempere d'aria – Raffreddamento – Essiccazione – Soffiaggio nei cubi-lotti – Scambiatori di calore – Alimentazione di gas vari sotto forti pressioni – Bruciatori di gas – Trasporto biogas - Surpressori di linea di gas – Saldature a gas sotto pressione – Bruciatori di nafta – Prove di motori a scoppio – Rimozione di trucioli e scorie – Sistemi di spruzzatura – Aspirazione, sotto forti depressioni, per ventose e simili – Soffiaggio ed aspirazioni nelle macchine tipografiche - Ossigenazione delle acque – Aspirazione centralizzata delle polveri.

Le soffianti MICO in fase di funzionamento possono generare un rumore superiore a 80 dB (A) secondo i valori prestazionali di portata e pressione, e in base alle caratteristiche riverberanti dell'ambiente.

La temperatura max del fluido in entrata è 100°C (riferito ad aria).

Il Δt delle temperature dei fluidi trattati dalla soffiante tra aspirazione e mandata è ~ 50°C

COSTRUZIONE:

- **Corpo centrale** in alluminio con stadi intermedi costituenti i diffusori ed i canali di ritorno, Il tutto assemblato mediante tiranti.
- **Testate** di aspirazione e mandata in alluminio con tenute a labirinto sul passaggio albero.
- **Rotore** costituito da giranti in alluminio a profilo alare. Le giranti calettate sull'albero in acciaio speciale, vengono equilibrate staticamente e dinamicamente.
- **Le giranti centrifughe** sono montate e calettate sull'albero in acciaio speciale.
- **I cuscinetti** (a sfera ed a rulli) sono alloggiati in supporti di ghisa con tenute ad anelli, la lubrificazione elimina automaticamente il grasso in eccesso.
- **Trasmissione** con cinghie e pulegge. Tendi cinghie su basamento porta motore.
- **Carter** di protezione in rete d'acciaio a norme antinfortunistiche su basamento porta motore

OPTIONAL

1)Basamento (per modelli 125, 160 e 220)

Unico soffiante/motore, in profilati d'acciaio di forte spessore.

2)Cabina fonoassorbente

La cabina afona viene utilizzata per abbattere il livello sonoro generato dal funzionamento della soffiante e per proteggerla contro gli agenti atmosferici nel caso d'installazione all'esterno.

L'abbattimento sonoro medio è di circa 20 dB (A), oltre tale livello e/o realizzazioni per installazioni particolari, consultare il Ns. ufficio tecnico.

La struttura della cabina afona è costituita da:

- Profilati in acciaio zincato
- Pannelli a doppia parete, esterno in lamiera zincata ed interno in rete microstirata, con interposta lana minerale fonoassorbente ad alta densità (Sp.45 mm.), e velovetro antisfaldamento.
- Basamento in profilati di acciaio saldato.

Posizione delle bocche eseguibili nella versione standard: 7-7 (per le altre posizioni bocche consultare il Ns. ufficio tecnico).

Optional per la cabina :

- Microinterruttore di sicurezza per porta.
- Illuminazione interna con interruttore esterno IP55.
- Verniciatura (se non richiesta la cabina viene fornita zincata)

Avvertenze

- La cabina è priva del pannello di fondo.
- Per l'installazione della soffiante nella cabina è obbligatorio l'uso di giunti antivibranti in aspirazione ed in mandata.

3)Filtro aspirante

Collocato prima della bocca di aspirazione è utilizzato per filtrare l'aria. Il filtro, a secco, è costituito da una struttura di supporto e fissaggio degli elementi filtranti di forma cilindrica flangiata. **Il filtro non è canalizzabile.**

4)Silenziatori

La bocca di aspirazione e la bocca di mandata sono le fonti di rumore più importanti presenti nella soffiante. Per una migliore riduzione della rumorosità è opportuno collocare i silenziatori il più vicino possibile alle bocche. I silenziatori devono essere sostenuti mediante staffe. **È necessario separare i silenziatori dalle bocche di aspirazione e mandata mediante giunti antivibranti.**

5)Giunto antivibrante in aspirazione e/o mandata

Vengono impiegati per l'allacciamento della bocca di aspirazione e/o mandata alle tubazioni da servire.

Il giunto impedisce la trasmissione delle vibrazioni da e verso la macchina e consente di assorbire le dilatazioni termiche. Gli accessori e le tubazioni collegati sopra il giunto devono essere opportunamente staffati in modo da non gravare sul giunto stesso.

6)Valvola di sicurezza

Valvola utilizzata per impedire il funzionamento della macchina a portate inferiori alla minima ammissibile.

7)Valvola di non ritorno

Valvola utilizzata per impedire il riflusso del gas trasportato.

8)Valvola manuale

Valvola a farfalla a comando manuale è presente allo scopo di controllare le prestazioni della macchina o la si voglia escludere dall'impianto.

9) Antivibranti di ancoraggio

Impediscono la trasmissione di vibrazioni e rumori alle strutture

Soffiante	Tipo	Quantità
MICO 90	AVFO25/15	4
MICO 125 e 160	AVFO25/15	8
MICO 220	AVFO25/20	8

10) Motori

Vengono installati motori con le seguenti caratteristiche:

	Volt	Rpm		Hz	forma	Classe	IP
Fino a 4 Kw	230/400	2900	triphas	50	B3	F	55
Oltre 4 Kw	400/690	2900	triphas	50	B3	F	55

PESI

Il peso indicato nelle tabelle è puramente indicativo. Nel peso della cabina afona sono esclusi motore, mico, trasmissioni e basamento.

MICO 220/7	700	320	680
MICO 220/8	800	360	680

TECHNICAL CHARACTERISTICS:

High-pressure multi-stage centrifugal blower with a wide range of applications, among which:

Pneumatical cleaning – Pneumatical transports – Pneumatical sample and post – agitations of liquids – moving of liquids with air jets – screens of air – tunnel ventilation – air handening – cooling – drying – blowing in the cupola – heat exchangers - alimentation of gas under strong pressure – gas burner – booster of gas line – gas welding under pressure – naphtha burners – trial of combustion engine – removing of chip and slag – spraying system – intake under strong depression for feeding sucker and similar – blowing and intake in the typographic machines.

When the MICO blowers are working, they can create noise levels that exceed 80 dB(A). The level depends on the flow rate and pressure performance values, and on the reverberating properties of the environment.

Maximum temperature of inlet fluid: 100°C (air).

Temperatures of fluids treated by the blower, between intake and delivery : Δt is $\sim 50^\circ\text{C}$

CONSTRUCTION:

- **Central case** in aluminium with intermediate stages consisting of distributors and return channels, assembled with tie-rods .
- **Aluminium intake and delivery heads** with labyrinth seal on shaft passage.
- **Rotor** consisting of aluminium finned impellers. The impellers clamped on the special steel shaft are statically and dynamically balanced.
- **The centrifugal impellers** are assembled and clamped on a shaft in special steel.
- **The ball and roller bearings** are housed in cast iron supports with loop seals, the lubrication automatically eliminates any excess grease.
- **Transmission** by belts and pulleys. Belt tighteners on motor mounting plate
- **Steel grid protection casing** complying to accident prevention standards on motor support base

OPTIONAL:

1)Base (MICO 125 – 160 – 220)

Blower/ motor single block, in very thick steel section.

2) Soundproof cabin

The soundproof cabin is used to abate the sound level generated by the operating fan and to protect it from severe weather conditions when it is installed outdoor.

The average sound reduction is approx. 20 dB(A); for higher sound decrease and/or special applications, please call our Technical Department.

The soundproof cabin framework consists of:

- Galvanized steel sections
- Double-wall panels, outside plated with galvanized sheet metal and inside covered with micro-expanded wire-netting, with hollow space filled with high-density deadening mineral wool (45 mm thick), and anti-disgregation fiberglass web.
- Base of welded section steel.

Location of the ports in the standard version: 7 - 7 (for other port locations, please call our Technical Department).

Cabin options:

- Door safety microswitch.
- Inside lighting with external switch IP55.
- Painting (otherwise, the cabin is delivered in the galvanized form)

Warnings

- The cabin is not provided with bottom panel.
- To install the blower in the cabin, vibration-damping couplings must be used on the intake and on the delivery lines.

3)Intake filter

Located before the air inlet to clean the air the dry filter consists of a cylindrical flanged structure to support and fasten the filtering elements. **The filter cannot be channelled.**

4)Silencers

The intake and delivery nozzles are the main sources of noise on the blower. To obtain the best results to lessen the noise, place the silencers as close as possible to the nozzles. Support the silencers by brackets. **Separate the silencers from the intake and delivery nozzles by vibration-damping couplings.**

5)Intake and/or delivery vibration-damping couplings

These couplings are used to couple the intake and/or delivery inlets to the piping .

The coupling prevents vibrations being transmitted from and to the machine and absorbs the thermal expansion. The accessories and pipes connected over the coupling are to be appropriately supported so they do not strain the coupling.

6)Safety valve

Valve used to prevent the machine functioning at flow rates that are less than the minimum allowed.

7)Check valve

Valve used to prevent conveyed gas reflux .

8)Manual valve

Manually controlled throttle valve, installed to control the machine performance or to cut it out from the system if desired.

9) Vibration-damping fastenings

To prevent vibrations and noise being transmitted to the structures

Blowers	Type	Quantity
MICO 90	AVFO25/15	4
MICO 125 e 160	AVFO25/15	8
MICO 220	AVFO25/20	8

10) Motors

The motors installed have the following characteristics:

	Volt	Rpm		Hz	form	Class	IP
Up to 4 Kw	230/400	2900	3-phase	50	B3	F	55
Over 4 Kw	400/690	2900	3-phase	50	B3	F	55

WEIGHTS

The weight indicated in the table is only indicative. The soundproof cabin weight does not include the motor, MICO, drives and base.

MICO 220/6	600	300	680
MICO 220/7	700	320	680
MICO 220/8	800	360	680

CARACTÉRISTIQUES :

Soufflante centrifuge multiétagée à haute pression d'un large domaine d'application, comme le:

Nettoyage automatique – transports pneumatiques – poste et échantillonnage pneumatique – Agitation des liquides - Évacuation des liquides par jet d'air – rideaux d'air – aération de tunnels trempés à l'air – refroidissement – séchage – soufflage dans les cubilots – échangeurs de chaleur – alimentation de gaz divers sous fortes pressions – Brûleurs à gaz – Surpresseur de lignes de gaz – soudures au gaz sous pressions - Brûleurs à mazout – Essais de moteurs à explosion – enlèvement de copeaux et scoriés – Systèmes de projection – Aspiration, sous fortes dépression, par ventouses et autres systèmes similaires.

En phase de fonctionnement, les soufflantes MICO peuvent générer un bruit supérieur à 80 dB(A) selon les valeurs des prestations de débit et de pression, et selon les caractéristiques réverbérantes de l'environnement.

La température max du fluide en entrée est de 100 °C (rapportée à l'air).

Le Δt des fluides traités par la soufflante entre l'aspiration et le refoulement est d'environ 50 °C.

COMPOSITION :

- **Le corps central** en aluminium à étages intermédiaires constituant les diffuseurs et les canaux de retour, le tout assemblé par tirants.
- **Les têtes** d'aspiration et de refoulement en aluminium avec joints à labyrinthe sur le passage de l'arbre.
- **Le rotor** constitué de roues en aluminium à profil d'aile. Les roues assemblées sur l'arbre en acier spécial sont équilibrées statiquement et dynamiquement.
- **Les roues centrifuges** sont montées et assemblées sur l'arbre en acier spécial.
- **Les roulements** (à billes ou à rouleaux) sont logés dans des supports en fonte munis d'anneaux d'étanchéité. La lubrification (par graisse) élimine automatiquement la graisse en excès.
- **La transmission** par courroies et poulies. Tendeur de courroie sur le bâti de support du moteur.
- **Le carter** de protection en grillage d'acier, conformément aux normes de prévention des accidents, sur le bâti de support du moteur.

OPTIONS :

1) Bâti (MICO 125 – 160 – 220)

Soufflante / moteur unique, en profilés d'acier de forte épaisseur.

2) Cabine insonorisée

La cabine insonorisée est utilisée pour l'affaiblissement du niveau sonore produit par le fonctionnement de la soufflante et pour la protéger contre les intempéries en cas d'installation à l'extérieur.

La réduction moyenne du niveau sonore est de 20 dB(A) environ ; pour des réductions plus importantes et/ou pour des installations spéciales, veuillez vous adresser à notre Bureau Technique.

La structure de la cabine insonorisée est formée de:

- Profils en acier galvanisé
- Panneaux à double paroi, le côté extérieur étant en tôle galvanisée et celui intérieur en treillis micro-étré, avec interposition de laine minérale antibruit de haute densité (45 mm d'épaisseur), et voile laine de verre anti-désagrégation.
- Bâti en profils d'acier soudé.

Position des bouches dans la version standard: 7 - 7 (pour d'autres positions, s'adresser à notre Bureau Technique).

Options de la cabine:

- Détecteur de sécurité de la porte.
- Eclairage à l'intérieur avec interrupteur placé à l'extérieur IP55.
- Peinture (si la peinture n'est pas demandée, la cabine sera fournie galvanisée)

Avertissements

- La cabine n'est pas dotée de panneau de fond.
- Pour l'installation de la soufflante dans la cabine, l'utilisation de manchons antivibratoires sur l'aspiration et le refoulement est obligatoire.

3)Filtre aspirant

Raccordé avant la bouche d'aspiration, il est utilisé pour filtrer l'air. Le filtre à sec est constitué d'une structure de support et de fixation des éléments filtrants de forme cylindrique à bride. **Le filtre n'est pas canalisable.**

4) Silencieux

La bouche d'aspiration et la bouche de refoulement représentent les sources de bruit les plus importantes de la soufflante. Afin de réduire le bruit, il faut placer les silencieux le plus près possible des bouches. Les silencieux doivent être montés sur pattes. **Il faut séparer les silencieux des bouches d'aspiration et de refoulement à l'aide de manchons antivibratoires.**

5) Manchons antivibratoires sur l'aspiration et/ou le refoulement

Ils sont utilisés pour le raccordement des bouches d'aspiration et/ou de refoulement aux tuyauteries à desservir.

Le manchon empêche la transmission des vibrations de et vers la machine et permet d'absorber les dilations thermiques. Les accessoires et les tuyauteries raccordées sur le manchon doivent être montées sur pattes afin de ne pas écraser le manchon.

6) Soupape de sécurité

Soupape utilisée pour empêcher le fonctionnement de la machine avec des débits inférieurs au minimum admissible.

7) Clapet anti-retour

Clapet évitant le reflux du gaz transporté.

8) Vanne manuelle

Vanne papillon à commande manuelle permettant de contrôler les prestations de la machine ou d'exclure l'installation.

9) Antivibratoires d'arrêt

Ils empêchent la transmission des vibrations et des bruits à la structure.

Soufflante	Type	Quantité
MICO 90	AVFO25/15	4
MICO 125 et 160	AVFO25/15	8
MICO 220	AVFO25/20	8

10) Moteurs

Les moteurs installés présentent les caractéristiques suivantes :

	Volt	Rpm		Hz	Forme	Classe	IP
Jusqu'à 4 kW	230/400	2900	triphasé	50	B3	F	55
Plus de 4 kW	400/690	2900	triphasé	50	B3	F	55

POIDS

Le poids indiqué dans les tableaux est purement indicatif. Le poids de la cabine insonorisée ne comprend pas le moteur, la soufflante, les transmissions et le bâti.

MICO 220/7	700	320	680
MICO 220/8	800	360	680

TECHNISCHE MERKMALE:

Mehrstufiges Hochdruck-Zentrifugal-Gebläse zur vielfachen Anwendung, wie zum Beispiel:

Pneumatische Reinigung – pneumatische Transporte – pneumatische Post und Bemusterungen – Schütteln von Flüssigkeiten – Entfernen von Flüssigkeiten durch Luftstrahl – Luftvorhänge – Tunnelbelüftung – Lufthärten – Kühlen – Trocknen – Blasen in die Kupolöfen – Wärmeaustauscher – Zuführung verschiedener Gase unter starken Drücken – Gasbrenner – Biogas-Transport – Turbogebälse Gaslinie – Gasschweißen unter Druck – Heizölbrenner – Explosionsmotorprüfungen – Entfernen von Spänen und Schlacken – Spritzsysteme – Ansaugen mit starken Unterdrücken für Saugköpfe u.ä. – Blasen und Ansaugen bei Druckmaschinen – Sauerstoffaufnahme – Zentralisiertes Ansaugen von Staub.

Die MICO-Gebläse können während der Arbeitsphase ein Geräusch erzeugen, das je nach den Leistungswerten der Förderung und des Drucks und je nach den nachhallenden Eigenschaften der Umgebung über 80 dB (A) liegt.

Die Höchsttemperatur des Fluids beim Einlass ist 100°C (auf die Luft bezogen).

Das Δt der Temperaturen der von dem Gebläse behandelten Fluide zwischen Einlass und Auslass beträgt $\sim 50^\circ\text{C}$.

BAUWEISE:

- **Zentraler Körper** aus Aluminium mit Zwischenstufen, die die Diffusoren und die Rückflusskanäle bilden. Die Gesamtheit wird mit Zugstäben zusammengebaut.
- **Einlass- und Auslassköpfe** aus Aluminium mit Labyrinthdichtungen am Wellendurchgang.
- **Rotor**, bestehend aus Aluminiumläufern mit Flügelprofil. Die auf die Welle aus Sonderstahl aufgezogenen Läufer werden statisch und dynamisch ausgewuchtet.
- **Die Zentrifugalläufer** sind auf die Welle aus Sonderstahl montiert und aufgezogen.
- **Die Lager** (Kugel- und Rollenlager) sind in Gusseisenlagern mit Ringdichtungen angeordnet; die Schmierung (mit Schmierfett) entfernt automatisch das überschüssige Fett.
- **Antrieb** mit Riemen und Riemenscheiben. Riemenspanner auf dem Motor-Untergestell.
- **Schutzvorrichtung** aus Stahlnetz, konform mit den Unfallverhütungsvorschriften, auf dem Motoruntergestell.

OPTIONAL:

1)Untergestell

Ein einziges Stück für Gebläse/Motor aus stark bemessenen Stahlprofilen.

2) Kabine

Die schalltote Kabine dient zur Dämpfung des von dem Betrieb der Gebläsemaschine erzeugten Schallpegels und zum Schutz vor den Witterungseinflüssen bei Aufstellung der Gebläsemaschine im Freien.

Die mittlere Schalldämpfung beträgt ca. 20 dB (A); bei höheren Schallpegeln und/oder besonderen Aufstellungsbedingungen setzen Sie sich bitte mit unseren technischen Kundendienst in Verbindung.

Der Aufbau der schalltoten Kabine besteht aus:

- Verzinkten Stahlprofilen
- Doppelwandtafeln, Außenwand aus verzinktem Blech, Innenwand aus mikrogestrecktem Drahtnetz, mit zwischengelegter schallschluckender Hochdicht-Gesteinswolle (Dicke 45 mm) und Spaltfest-Glasfaservlies.
- Untergestell aus geschweißten Stahlprofilen.

Stellung der Öffnungen in Standard-Ausführung: 7 - 7 (für andere Stellungen der Öffnungen setzen Sie sich bitte mit unserem technischen Kundendienst in Verbindung).

Optional für die Kabine:

- Sicherheitsmikroschalter für Tür.
- Innere Beleuchtung mit externem Ausschalter IP55.
- Lackierung (falls nicht gefragt, wird die Kabine verzinkt geliefert)

Hinweise

- Die Kabine hat keine Bodenplatte.
- Bei Installation des Gebläses in der Kabine ist der Einsatz von schwingungsdämpfenden Kupplungen am Ein- und Auslass unbedingt erforderlich..

3)Ansaugfilter

Angeordnet vor der Ansaugmündung dient er zum Filtern der Luft. Der Trockenfilter besteht aus einer zylinderförmigen, geflanschten Struktur zur Halterung und Befestigung der Filterelemente. **Der Filter ist nicht kanalisierbar.**

4)Schalldämpfer

Die Ansaugmündung und die Auslassmündung sind die wesentlichsten Geräuschquellen des Gebläses. Um eine einschlägige Verminderung des Geräuschs zu erreichen wird empfohlen, die Schalldämpfer so nahe als möglich an den Mündungen anzuordnen. Die Schalldämpfer sind durch Bügel zu befestigen. Die Schalldämpfer müssen von den Ansaug- und Auslassmündungen durch schwingungsdämpfende Dichtungen getrennt werden.

5)Schwingungsdämpfende Dichtung beim Einlass bzw. Auslass

Dieselben werden zum Anschluss der Einlass- und Auslassmündung an die Leistungsleitungen verwendet.

Die Dichtung verhindert die Übertragung der Schwingungen von und zur Maschine und ermöglicht die Absorption der Wärme- dehnungen.

Die einzelnen Bestandteile und die über der Dichtung angeschlossenen Leitungen müssen entsprechend mit Bügeln befestigt werden, um die Dichtung selbst nicht zu belasten.

6)Sicherheitsventil

Dieses Ventil wird verwendet, um den Betrieb der Maschine bei Fördermengen unter der zulässigen Mindestgrenze zu verhindern.

7)Rückflussventil

Dieses Ventil wird verwendet, um den Rückfluss des transportierten Gases zu verhindern.

8)Handventil

Manuell betätigte Ventilklappe dient zur Überprüfung der Maschinenleistungen oder zum Ausschluss derselben von der Anlage.

9)Verankerungs-Schwingungsdämpfer

Dieselben verhindern die Übertragung des Geräuschs und der Schwingungen auf die Strukturen

Gebläse	Modell	Menge
MICO 90	AVFO25/15	4
MICO 125 und 160	AVFO25/15	8
MICO 220	AVFO25/20	8

10)Motoren

Es kommen Motoren mit folgenden Merkmalen zum Einsatz:

	Volt	Upm		Hz	Form	Klasse	IP
Bis 4 Kw	230/400	2900	Drehstrom	50	B3	F	55
Über 4 Kw	400/690	2900	Drehstrom	50	B3	F	55

GEWICHTE

Das in der Tabelle angegebene Gewicht ist unverbindlich. Im Gewicht der schalltoten Kabine sind Motor, MICO, Antriebe und Untergestell nicht enthalten.

MICO

Cabina afona - Sound-proof box - Caisson d'insonorisation - Schelldichte senkksten

Caratteristiche

La cabina afona viene utilizzata per abbattere il livello sonoro generato dal funzionamento della soffiante e per proteggerla contro gli agenti atmosferici nel caso di installazione all'esterno. L'abbattimento sonoro medio è di circa 20 dB (A), oltre tale livello e/o realizzazioni per installazioni particolari, consultare il Ns. ufficio tecnico. Posizione delle bocche eseguibili nella versione standard : 7 - 7 (per le altre posizioni bocche consultare il Ns. ufficio tecnico).

Avvertenze

- La cabina è priva del pannello di fondo.

Features

The soundproof cabin is used to abate the sound level generated by the operating fan and to protect it from severe weather conditions when it is installed outdoor. The average sound reduction is approx. 15 dB(A); for higher sound decrease and/or special applications, please call our Technical Department.

Location of the ports in the standard version: 7 - 7 (for other port locations, please call our Technical Department).

Warnings

- The cabin is not provided with bottom panel.

Caractéristiques

La cabine insonorisée est utilisée pour l'affaiblissement du niveau sonore produit par le fonctionnement de la soufflante et pour la protéger contre les intempéries en cas d'installation à l'extérieur. La réduction moyenne du niveau sonore est de 15 dB(A) environ ; pour des réductions plus importantes et/ou pour des installations spéciales, veuillez vous adresser à notre Bureau Technique.

Position des bouches dans la version standard : 7 - 7

(pour d'autres positions, s'adresser à notre Bureau Technique).

Avertissements

- La cabine n'est pas dotée de panneau de fond.

Eigenschaften

Die schalltote Kabine dient zur Dämpfung des von dem Betrieb der Gebläsemaschine erzeugten Schallpegels und zum Schutz vor den Witterungseinflüssen bei Aufstellung der Gebläsemaschine im Freien. Die mittlere Schalldämpfung beträgt ca. 15 dB (A); bei höheren Schallpegeln und/oder besonderen Aufstellungsbedingungen setzen Sie sich bitte mit unseren technischen Kundendienst in Verbindung.

Stellung der Öffnungen in Standard-Ausführung: 7 - 7

(für andere Stellungen der Öffnungen setzen Sie sich bitte mit unserem technischen Kundendienst in Verbindung).

Hinweise

- Die Kabine hat keine Bodenplatte.

AMMORTIZZATORI ANTIVIBRANTI:

Impediscono la trasmissione di vibrazione alle strutture sono realizzati in materiale metallo gomma speciale. Temperatura di esercizio -20° +80°.

VIBRATION DAMPERS:

Prevent noise and vibration transmission to the frameworks, made of special metal rubber material. Working temperature range -20°C to +80°C.

AMORTISSEURS ANTIVIBRATOIRES:

Empêchant la transmission des vibrations et du bruit aux structures, réalisés en matière métal-caoutchouc. Température de service de -20°C a +80°C.

SCHWINGUNGSDÄMPFER:

Verhindern die Übertragung von Schwingungen Geräusche an die Strukturen, sind aus speziellem Metall-Gummi-Material hergestellt. Betriebstemperatur -20°C +80°C.
